

## Transform to an Electronic Environment, Enhance Patient Care.

Though HITECH, EMR and Meaningful Use initiatives have propelled hospitals into the electronic age, paper processes continue to be a source of pain. Standard Register Healthcare offers a solution to migrate all remaining paper processes into an electronic **paperless environment**.

Standard Register's SMARTworks® Clinical Enterprise transforms clinical processes. It streamlines workflows and enables you to easily access, manage and produce critical communications electronically, whenever and wherever they are needed. What's more, with the experience Standard Register brings in managing both paper and electronic forms and workflows, we are uniquely qualified to support your hospital or health system in automating workflows to complement your EMR.

### THE VALUE CAN BE FELT ENTERPRISE-WIDE:

- *Helps achieve meaningful use requirements*
- *Complements every stage of EMR*
- *Ensures compliance*
- *Lowers costs*
- *Reduce risks and adverse drug events*
- *Improves reimbursement process, reduces registration-related denials*
- *Enhances patient safety*

“Standard Register took us from an antiquated age of manual processes to the 21st century with their technology.”

– Patient Access Services Director, UMC of Southern Nevada

# Automate Your Workflows for Improved Results

We create a completely paperless environment with an enterprise software system, comprised of several components. It all starts by automating the admissions process. Guided by a rules-based server and patient information from your ADT system, SMARTworks Clinical Enterprise generates all the needed forms, based on factors such as patient and financial type. Then, it integrates patient demographics with the corresponding bar-codes. That same capability extends to your nursing units and every department throughout your system with the FormsOnDemand library. It puts the most current, compliant electronic documentation at your staff's fingertips, adding patient data and bar codes as documents are selected to assure data accuracy and eliminate indexing of paper documents.

## There's Much More, Of Course, Including:

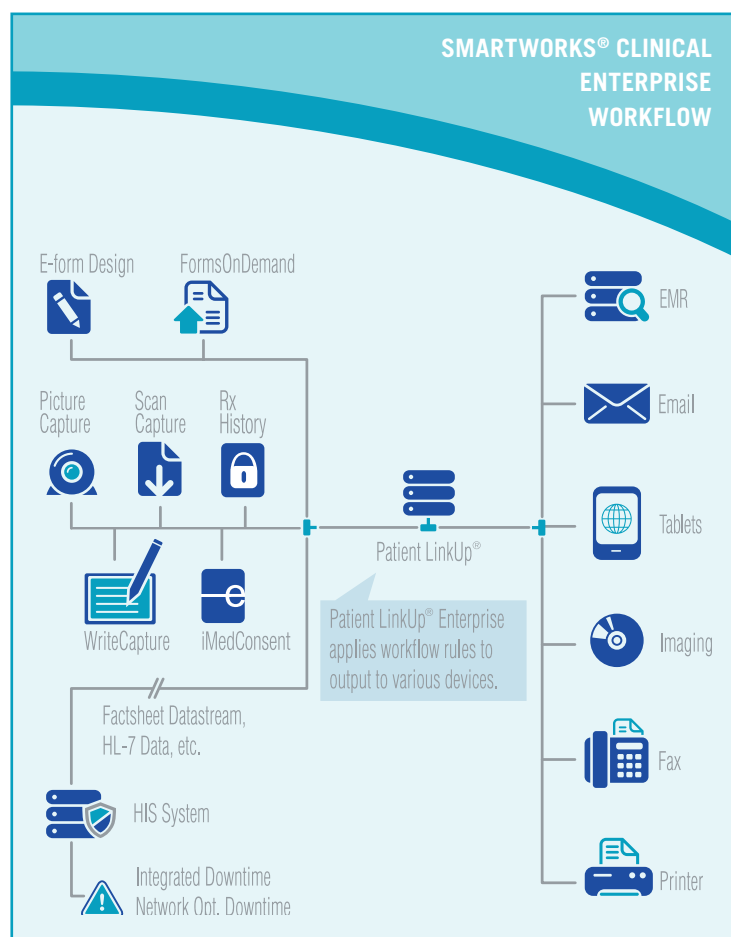

**IMEDCONSENT:** An automated solution for Informed Consent, this Web-based tool prepares easy-to-understand, procedure-specific consent forms for more than 2,200 treatments and procedures. This clinical content library includes anatomical images, discharge instructions, drug monographs and over 4,000 patient education documents. All can be filled out and managed electronically.

**WRITECAPTURE:** Enables you to fill out and capture all required patient-facing documentation and signatures electronically, and then submit them directly into the EMR. This can enhance speed to value of EMR and improve revenue cycle management (RCM).

**RX HISTORY:** Pulls a list of prescribed medications the patient has had filled in the last 12 months. This Rx History list can be submitted directly into the Medication Reconciliation module of the EMR. Helps you achieve Meaningful Use and National Patient Safety Goal #3.

**SCANCAPTURE:** Enables you to scan patient information such as identification, insurance cards and advance directives directly into the EMR which automatically allows the business office to see an electronic legible copy to begin the validation process and reduce registration related denials. Improves RCM.

**DOWNTIME APPLICATION:** Provides an electronic back-up solution to patient clinical documentation when your HIS system and/or network are down, so you can maintain the integrity of your critical communications and focus on patient care.
